

HAVE TOTAL PEACE OF MIND

It is common knowledge that after several years of your new fibreglass pool being installed there is a good chance that the following will happen eventually:

- 1) Your Paving will come loose (due to flexing under coping)
- 2) The step and seat area around your pool will drop slightly.

These two common problems are due to a lack of support around the top edge of the pool and also the large amount of water in your pool.

Interlocking/concrete reinforced support beam

How it works:

STEP 1

The area around the pool is reinforced with two rows of Y-12 bar & connected to the pool

STEP 2

Concrete is then poured around the pool.
330mm wide 150mm deep.

STEP 3

The concrete is locked under the pool's edge beam & bound to the Y-12 bar.
Ready for immediate paving

By locking your pool into place (as pictured above) we can guarantee your pool will never move or drop.

Another major benefit of the interlocking support beam is that your paving or header course has a solid foundation to sit on, this will prevent any unwanted flexing around the pool's coping which may result in the pavers falling off.

Barrier Reef Pools WA

Standard Inclusions Unique To Barrier Reef Pools WA

- ✓ Aqua Guard cultured shimmer finish supplied from FGI
- ✓ Advanced Klegecell structural ribbing around pool shell
- ✓ Water Corp & Council fees
- ✓ Supply & fit swimming pool complete with hydrostatic valve
- ✓ Excavation on a level sandy site (2m access)
